## Worksheet 20: Pendulums

1. A torsional oscillator can be thought of as a torsion spring with torque constant $\kappa$ and a rotor with moment of inertia $I$. Its kinematics follow an angular Hooke's law torque $\tau=-\kappa \theta$ and the angular Newton's second law $\tau=I \alpha$, where $\alpha=d^{2} \theta / d t^{2}$. Its angular displacement is given by the function $\theta=\cos (\omega t+\phi)$.

What is the value of $\omega$ in this function, in terms of the characteristics of the spring and rotor?
2. The small-angle approximation models $\sin \theta \approx \theta$ in radians. How small does $\theta$ need to be for this to be a decent approximation?

| $\boldsymbol{\theta}$ | $\sin \boldsymbol{\theta}$ | $\boldsymbol{\theta}-\sin \boldsymbol{\theta}$ | $(\theta-\sin \boldsymbol{\theta}) / \sin \boldsymbol{\theta}$ |
| :--- | :--- | :---: | :---: |
| $1 / 180 \pi$ |  |  |  |
| $2 / 180 \pi$ |  |  |  |
| $5 / 180 \pi$ |  |  |  |
| $10 / 180 \pi$ |  |  |  |
| $20 / 180 \pi$ |  |  | $1 \%$ |
| $45 / 180 \pi$ |  |  | $5 \%$ |
|  |  |  | $10 \%$ |
|  |  |  |  |

4. Find the length of a simple pendulum with a period of oscillation of 2.0 s .
